NOAA Technical Memorandum NMFS

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

ABSTRACT

This report provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) cruises conducted off California and Baja California in 1952. It is the second report in a series that presents these data for all biological-oceanographic CalCOFI surveys from 1951 to the present. A total of 1491 stations was occupied during 11 monthly multivessel cruises over the quarter-million square mile survey area which extends from the California-Oregon border to Cape San Lucas, Mexico and seaward to several hundred miles. The data are listed in a series of 6 tables; the background, methodology, and information necessary for interpretation and quantitative analysis of the data are presented in an accompanying text. All pertinent station and tow data, including volumes of water strained and standard haul factors are listed in the first table. Another key table lists, by station and month, standardized counts of each of the 120 larval fish categories identified from survey samples. This and previous and subsequent reports make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the newly developed computer data base.

INTRODUCTION

This report, the second of a series, provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) joint biological-oceanographic survey cruises conducted in 1952. This program was initiated in 1949, under the sponsorship of the Marine Research Committee of the State of California, to study the population fluctuations of the Pacific sardine (*Sardinops sagax*) and the environmental factors that may play a role in such fluctuations. CalCOFI, known as the California Cooperative Sardine Research Program from 1949 to 1953, was made up of representatives of the South Pacific Fisheries Investigations (SPFI) of the U.S. Fish and Wildlife Service [now the La Jolla Laboratory, National Marine Fisheries Service (NMFS)], the Scripps Institution of Oceanography (SIO), the California Department of Fish and Game (CDFG), the California Academy of Sciences (CAS) and the Hopkins Marine Station of Stanford University. The first three of these agencies supplied ships and personnel to conduct the sea surveys. NMFS processed the plankton samples and analyzed the ichthyoplankton from them. SIO processed and analyzed the hydrographic samples and measurements and also analyzed invertebrate groups from the plankton samples.

The boundaries, station placement, and sampling frequency for the CalCOFI survey area were based on the results of joint biological and oceanographic cruises conducted by NMFS and SIO during 1939-41. Those cruises were designed to collect sardine eggs and larvae and associated hydrographic data over the entire areal and seasonal spawning range of the species. On these survey cruises, plankton tows were made to 70 m, a depth which

encompassed the vertical distribution of sardine eggs and larvae. Wide-ranging joint biological and oceanographic survey cruises were resumed in 1949 with sardine as the focus; however, an increasing interest in other biological components resulted in the deepening of standard tows to 140 m in 1951. This marked the beginning of truly quantitative ichthyoplankton sampling on CalCOFI surveys.

Data resulting from CalCOFI surveys in 1952 have been published in a number of forms. Hydrographic data (Reid et al., 1965), zooplankton volumes (Staff, SPFI, 1953; Threlkild, 1956; Smith, 1971) and ichthyoplankton data for selected species (Ahlstrom, 1954) were presented in standard formats. The latter lists counts for eggs and larvae of sardine and for larvae of northern anchovy (*Engraulis mordax*), jack mackerel (*Trachurus symmetricus*), Pacific mackerel (*Scomber japonicus*), Pacific hake (*Merluccius productus*), and rockfishes (*Sebastodes* spp.). Also, length frequencies are listed for sardine, anchovy, and jack mackerel larvae. Distribution maps of larvae of 5 of these taxa taken on CalCOFI surveys during 1952 are presented in the CalCOFI Atlas series (Kramer and Ahlstrom, 1968; Ahlstrom, 1969; Kramer, 1970; Ahlstrom et al., 1978).

A computer data base for eggs and larvae of sardine and anchovy and for larvae of hake, and the two mackerels was established in 1969. The development of a data base for other fish larvae is a complex undertaking because competency of identification has evolved steadily over the past 38 years. We began the task of producing a CalCOFI ichthyoplankton data base and associated data report series in 1983. All available original records for 1952 were subjected to an extensive verification and editing process to produce this report. This, and previous (Ambrose et al., 1987) and subsequent reports, make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the computer data base. The data base will be modified when additional errors are discovered and when composite taxa from the earlier years are reidentified. These reports are the fundamental reference documents against which subsequent changes in the data base can be compared.

SAMPLING AREA AND PATTERN

In 1952, CalCOFI survey cruises were conducted at monthly intervals, except during December. A total of 1491 stations included in this data base was occupied on 11 cruises, with an average of 135 stations per cruise (range of 88 - 227). Coverage of the survey station pattern varied among cruises and the entire quarter-million square mile survey area was not covered on any single cruise (Figures 1-12; Table 1). The area off northern California (lines 40-57) was sampled only in June and July. Coverage off central California (lines 60-77) was more consistent with stations occupied monthly, from April to November. While the area surveyed during 1952 was less extensive than in 1951, the coverage between Pt. Conception, California and Pt. San

Juanico, Baja California (lines 80-137) was sampled more consistently and was surveyed on all 11 cruises. The area off southern Baja California (lines 140-150) was surveyed only once (February). Offshore coverage was not as extensive as in 1951 and occasionally reached station 110 (approximately 250 miles offshore) only on lines 60 and 80. Station 90 was the most seaward station sampled over most of the pattern. Offshore coverage was greatest from January to July and diminished during later cruises.¹

Seven vessels were employed on these cruises: the *Black Douglas* of NMFS; the *Crest*, *Horizon*, *Paolina T*, *Spencer F. Baird*, and *E. W. Scripps* of SIO; and the *Yellowfin* of CDFG. Two to four vessels participated on each cruise with three being the usual number. The *Crest* was used on all cruises except 5205 and the *Black Douglas* on all but 5207, 5209, and 5210. The other five vessels participated on a total of 14 cruises (Ahlstrom, 1954).

SAMPLING GEAR AND METHODS

The standard CalCOFI net used from 1949 to 1969 had a 1-m diameter mouth opening (0.785 m^2 area) and an overall length of about 5 m. The net was constructed of 30xxx gauze, a heavy duty grade of silk bolting cloth, with a mesh size of 0.55 mm after shrinkage. The last 40 cm of the cone and the cod end were constructed of 56xxx grit gauze which had a mesh size of 0.25 mm after shrinkage. The net ring was fastened to a short 3-lead bridle connected to several meters of line which attached to the towing cable by a clamp. A current meter was suspended in the center of the net mouth to measure volume of water filtered (see Kramer et al., 1972, for further details).

The standard tow from 1951 through 1968 was an oblique haul to 140 m depth (to 15 m of the bottom in shallow areas) designed to filter a constant amount of water per depth interval (ca. $3\text{m}^3/\text{m}$ of depth) over the vertical range of most ichthyoplankters. Hauls were made at a ship speed of 1.5-2.0 knots and initiated by

¹CalCOFI lines (Figure 13) are arranged perpendicular to the coastline and extend from the Canadian border (line 10) to below Cape San Lucas, Baja California (line 157). Stations were established on the basis of a perpendicular to line 80 (off Pt. Conception) at a point designated as station 60. Stations were plotted seaward and shoreward from station 60 on each line. Cardinal CalCOFI lines (those ending in "0") are 120 miles apart and usually bracket two ordinal lines (ending in "3" or "7"), so that lines are 40 miles apart over most of the pattern. Cardinal stations are 40 miles apart and typically these are separated by a station number ending in "5" so that stations are 20 miles apart out to station 90 on most lines. Stations are placed at closer intervals near the coast and islands to accommodate these features (see Kramer et al., 1972 for further details).

clamping the net line to the towing cable with the 45 kg terminal weight about 10-15 m below the surface. The net was lowered to 140 m depth by paying out 200 m of wire over a 4 minute period (35 m of depth/min.). After fishing at depth for 30 seconds, the net was retrieved at 20 m/min. (14 m depth/min.). The angle of stray of the towing cable was recorded every 30 seconds and maintained at 45° ($\pm 3^\circ$) by adjusting the ship speed and course. After reaching the surface, the net was washed down and the samples preserved in 5% formalin buffered with sodium borate. Flowmeter readings were made at the beginning and end of each tow. Detailed descriptions of gear and methods are given by Ahlstrom (1954), Kramer et al. (1972), and Smith and Richardson (1977).

LABORATORY PROCEDURES

Laboratory processing began with the determination of a displacement volume for each sample (methods described in Staff, SPFI, 1953 and Kramer et al., 1972). Zooplankton volumes (including ichthyoplankton) of samples collected in 1952 are listed in Staff, SPFI (1953) and presented graphically in Thrailkill (1956) and Smith (1971).

Sorting involved the removal of ichthyoplankton from the sample and identification and separation of eggs and larvae of selected species (see introduction). Usually, each sample was sorted completely; however, some of the samples were fractioned into aliquots using a Folsom plankton splitter (McEwen et al., 1954) prior to sorting. Several criteria² were used to determine whether a sample was fractioned: samples containing an abundance of thaliacians and coelenterates and exceeding 150 ml in total plankton volume were fractioned (to 50%, 25%, 12.5%, or 6.25%) to approximate a reduced volume of 50 ml for sorting; samples with an excessive quantity of fish eggs and/or larvae were occasionally fractioned to expedite the sorting process in order to meet scheduled deadlines. If the identified fraction of an aliquot yielded rare or interesting species of fish larvae, the remaining fraction was frequently sorted and identified with the intent of finding additional specimens. Aliquot percentages for fractioned samples from 1952 are listed in Table 1 under the "Percent Sorted" column.

A "standard haul factor" (SHF) was calculated for each tow to make them comparable and allow estimations of areal abundance. This factor adjusts the number of eggs or larvae in a haul to the number in 10 m³ of water strained per meter of depth fished. If the vertical distribution of the species has been encompassed, then the adjusted value is equivalent to the number under 10 m² of sea surface. The SHF is calculated for each haul by the formula:

²Personal communication, James R. Thrailkill, National Marine Fisheries Service, Southwest Fisheries Center, La Jolla, CA.

$$SHF = \frac{10 D}{V}$$

where D = depth of haul = cosine of the average angle of strain of the towing cable multiplied by cable length (m)

V = total volume of water (m^3) strained during the haul

$$V = R \cdot a \cdot p$$

where R = total number of revolutions of the current meter during the haul

a = area (m^2) of the mouth of the net

p = length of column of water (m) needed to produce one revolution of the current meter.

Tow depth, volume of water strained, and standard haul factor are listed in Table 1 for each tow taken during 1952. Detailed descriptions of factors involved in calculating these values are presented in Ahlstrom (1948), Kramer et al. (1972), and Smith and Richardson (1977).

IDENTIFICATION

Identification of ichthyoplankton species beyond those separated during the sorting process was carried out by a separate group of specialists. Ontogenetic stages of fishes are inherently difficult to identify and this is further complicated by the large number and diversity of species which contribute to the ichthyoplankton of the California Current region. Most identifications were accomplished by establishing ontogenetic series on the basis of morphology, meristics, and pigmentation and then identifying these series by relating them to known metamorphic, juvenile, or adult stages with overlapping features (Powles and Markle, 1984). A total of about 118 taxa was identified for 1952, with 67 taken to species, 21 to genus, 25 to family, and 5 to order. Some of the developmental series recognized originally could not be assigned scientific names, particularly in the Bathylagidae, Myctophidae, and Pleuronectiformes. These were given descriptive names, which later were changed to scientific names as they became known.

The task of producing a reliable and equitable ichthyoplankton data base required extensive procedures to verify, correct, and edit the original identifications. The primary data source was the original identification sheets (see Kramer et al., 1972, for examples); however, a critical resource used in all phases of this process was the CalCOFI

ichthyoplankton collection in which the samples are archived. Throughout the course of CalCOFI ichthyoplankton studies, samples have been identified to the lowest taxon possible. In reviewing these identifications for the data base, our approach has been conservative and we have preserved those identifications and counts which we could confirm, while correcting as many of the errors as possible. During the coding of the identification sheets, the "descriptive types" were assigned scientific names and reexamined, if necessary. After computer entry, taxonomic errors and inconsistencies in the data base were corrected and the most obvious identification errors were corrected. Our current knowledge of ichthyoplankton techniques coupled with a precise understanding of the development of identification competency in the program over the years allowed us to critically judge the historical records. Identifications were changed to different taxa, lumped to a higher taxonomic category, or given a more precise taxonomic name. In many cases, identifications of a taxon were inconsistent among cruises in a year, because of varying competency of identifiers. These records were made equitable by lumping to the higher taxonomic category to avoid biases that could result in quantitative misinterpretations.

Next, statistical, seasonal, and geographic outliers were identified, employing a series of graphic summaries and listings. Examination of geographic outliers proved to be especially effective because of our accumulated knowledge of species distributions. In the course of examining samples for these outliers, other identification errors were discovered and eventually all taxa were scrutinized to some extent. Lastly, certain taxa were reexamined in all samples for the entire CalCOFI time series. These taxa were selected because of their commercial, ecological, phylogenetic, or zoogeographic importance or because taxonomic confusion was at the ordinal level. The following is a list of the taxa for 1952 which received special attention, with explanations and caveats intended to aid in quantitative interpretations:

Anguilliformes - tentative and sporadic identifications to family or lower taxon lumped to order.

Sardinops sagax - all specimens south of line 120 checked for misidentification of *Opisthonema* spp.

Engraulidae - includes nearshore taxa (mostly *Anchoa* spp.) large enough to separate from *Engraulis mordax*; some nearshore samples of small *E. mordax* may contain other anchovy genera, but could not be differentiated.

Nansenia spp. - all specimens checked and identified as *N. candida* or *N. crassa*; all specimens of these species near their range boundaries checked.

Sternopychidae - tentative and sporadic identifications of hatchetfishes to genus were lumped to family.

Bathophilus spp. - all specimens checked.

Tactostoma macropus - all specimens checked; all listings of *Bathophilus* spp. were specimens of *T. macropus*.

Scopelarchidae - tentative and sporadic identifications to genus lumped to family.

Lampanyctus spp. - tentative and sporadic identifications to species (mostly descriptive types) lumped to genus.

Stenobrachius leucopsarus - all specimens at margins of range checked.

Diogenichthys spp. - all specimens reidentified to species; residuals are small poorly preserved specimens.

Diogenichthys atlanticus - all specimens at margins of range checked.

Diogenichthys laternatus - all specimens at margins of range checked.

Electrona rissoei - recognition of this species was inconsistent and others may be included in *Protomyctophum crockeri* or *Myctophidae*; no original identifications were recorded in 1952.

Hygophum spp. - all specimens reidentified to species; residuals are small, poorly preserved specimens.

Protomyctophum crockeri - some samples on northern lines may contain *P. thompsoni*, which was not identified at the time.

Symbolophorus californiensis - all specimens south of line 120 checked for confusion with *Hygophum* spp., stemming from descriptive names.

Merluccius productus - all specimens south of line 140 checked.

Ophidiiformes - this category did not exist originally and ophidiiform larvae were included in *Brosmophysis marginata*, *Carapidae*, "Otophidium", "Zoarcidae", and "blenny"; identifications of *B. marginata* proved to be mostly correct and "Zoarcidae" to be a yet unidentified ophidiiform species; all "Otophidium" and "blenny" were reexamined and the former included *Ophidion scrippsae*, *Chilara taylori* and other ophidiiform taxa (moved to order); "blenny" contained *O. scrippsae*, *C. taylori*, and other ophidiiform taxa in addition to true blennioids.

Ceratioidei - identifications of this group were inconsistent and additional specimens may be in the unidentified fish larva category.

Trachipteridae - tentative and sporadic identifications to genus were lumped to family.

Melamphaes spp. - all identifications ascribed to Melamphaidae were reexamined and assigned to genus (*Melamphaes*, *Poromitra*) or species (*Scopelogadus bispinosus*); larvae originally identified as *Melamphaes* spp. were not reexamined and this category may contain other melamphaid genera.

Cottidae - some samples may include specimens of *Scorpaenichthys marmoratus*, hexagrammids (e.g., *Oxylebius pictus*, *Zaniolepis* spp.), and some blennioids (e.g., *Hypsoblennius* spp.).

Zaniolepis spp. - not identified originally; specimen identified recently from Cottidae.

Scorpaenidae - now includes genera (*Pontinus*, *Scorpaena*, *Scorpaenodes*) other than *Sebastes*; some of these other genera remain in *Sebastes*, particularly on southern lines.

Sebastes spp. - in addition to other scorpaenid genera, category includes some *Prionotus* spp., serranids, scombrids, and other spiny-headed shorefishes, particularly in samples south of line 120.

Hypsoblennius spp. - some specimens remain in Cottidae.

Clinidae - some specimens remain in Cottidae or unidentified fish larva category.

Labridae - tentative and sporadic identifications to genus were lumped to family.

Chromis punctipinnis - records south of about line 120 may include other pomacentrid taxa.

Carangidae - all specimens checked; tentative and sporadic identifications to genus or species (except *Trachurus symmetricus*) were lumped to family.

Gerreidae - larvae of this family and other shorefishes (e.g., Haemulidae, *Caulolatilis princeps*, Mullidae, Priacanthidae) were not identified and may be in the unidentified fish larva category or may be misidentified as *Sebastes* spp., Cottidae, etc.

Girella nigricans - all specimens checked.

Medialuna californiensis - all specimens checked.

Scombridae - all larvae identified to this family or constituent taxa (except *Scomber japonicus*) were reexamined and reassigned; underrepresentation or absence of these taxa may be attributed to misidentification or they may be in the unidentified fish larva category.

Nomeidae - absence of this family attributed to misidentification or placement in unidentified fish larva category.

Pleuronectiformes - all available specimens of this category (originally called "flatfish") were examined and reidentified; residuals are small, poorly preserved specimens.

Bothidae - all specimens examined and most were reassigned to various paralichthyid genera or to *Bothus* spp.

Citharichthys spp. - tentative and sporadic identifications to species were lumped to genus, which also includes *Etropus* spp. and some other flatfish taxa from original misidentifications.

Hippoglossina spp. - all specimens of this genus (originally called "pigmented bothid") were assigned to *H. stomata*.

Paralichthys spp. - all specimens of this genus were examined and most were assigned to *P. californicus* or *Xystreurus liolepis*.

Syacium ovale - all specimens examined (originally called "spiny-headed bothid").

Xystreurus liolepis - originally misidentified as *Paralichthys californicus*; all specimens reidentified.

Glyptocephalus zachirus - all specimens examined.

Microstomus pacificus - all specimens examined.

Pleuronichthys spp. - all larvae of this genus and constituent species were examined and assigned to species; residuals are small, poorly preserved specimens.

Psettichthys melanostictus - absence of this species may be explained by misidentification with other flatfish species (e.g., *Lyopsetta exilis*) which we did not reexamine systematically.

COMPUTER ENTRY AND EDITING

Each taxon on the original identification sheets was given a 3-digit code based on the list of codes in Haight et al. (1979). Taxon codes and counts from these sheets were keypunched by cruise and station, along with pertinent station and tow data and entered into the VAX 11/780 computer at the University of California, San Diego Computing Center. After entries were completed for an entire year, print-out listings of taxa and counts on each station were compared with the original data sheets to eliminate keypunch errors. Next, data in the file were cross-checked with data on an existing file which contained: station and tow data; numbers of eggs of sardine, anchovy, and

saury (*Cololabis saira*); numbers of larvae of sardine, anchovy, hake, jack mackerel, and Pacific mackerel; total number of fish eggs; and total number of fish larvae.

Discrepancies in ichthyoplankton data in these two files were corrected by inspecting original records from the sorting laboratory, the original ichthyoplankton identification sheets, and the samples themselves. Station and tow data discrepancies between the two files were corrected by reviewing ships' logs and deck tow sheets, original records from the sorting laboratory, cruise announcements, publications, header information on the ichthyoplankton identification sheets, and station plots generated for each cruise. Eventually all station and tow data were checked by comparing these sources.

The corrected ichthyoplankton data base was then examined statistically and outliers were found and checked as above. Distributional plots were then prepared for each taxon and these were checked by reviewing the data sources mentioned above and by examining archived specimens. A listing of each taxon by station (Table 4) was produced, which became the primary document for subsequent checks. Misidentifications found in geographic outlier checks and other misidentifications and data problems discovered in the course of examining archived samples resulted in several iterations of Table 4. Finally, totals in Table 4 were checked against annual summaries of incidence and abundance (Tables 2 and 3). Ecological analyses of the data (Moser et al., 1987) were conducted concurrently with editing procedures and provided cross-checks that allowed correction of errors.

SPECIES SUMMARY

Larvae of northern anchovy (*Engraulis mordax*) represented 16% of all fish larvae taken on CalCOFI cruises in 1952 and ranked 4th in occurrence (Tables 2 and 3). The next most abundant species, Pacific hake (*Merluccius productus*), represented 15.4% of all fish larvae taken. The deepsea smelt (*Leuroglossus stibius*) and sardine (*Sardinops sagax*) ranked 3rd and 4th in abundance. Sardine incidence was comparatively low (15th) as was hake (12th) indicating relatively large sample sizes. The next most abundant species, a lanternfish (*Triphoturus mexicanus*), the sanddab genus *Citharichthys*, and a gonostomatid (*Vinciguerria lucetia*), ranked 5th, 6th, and 7th respectively. *Triphoturus mexicanus* ranked 1st in occurrence. Jack mackerel larvae (*Trachurus symmetricus*) ranked 8th in abundance and occurrence. Larvae of *Sebastes* spp., a composite of about 70 species, ranked 9th in abundance and 2nd in occurrence. The 10th ranked taxon in abundance was a lanternfish (*Stenobrachius leucopsarus*). These 10 top-ranking taxa contributed 84.5% of all larvae taken during 1952. The remaining 15.5% is represented by 108 taxa plus the "unidentified" and "disintegrated" categories. Of the 10 taxa, 4 were midwater species, 3 were coastal demersal species or generic groupings, and 3 were coastal pelagic species.

EXPLANATION OF TABLES

- Table 1 - This table lists by cruise the pertinent station and tow data for 1952, the volume of water filtered and standard haul factor for each tow, the percent of sample sorted, and the total numbers of fish eggs and larvae. CalCOFI cruises are designated by four digits; the first two indicate the year and the second two the month. Within each cruise the data are listed in order of increasing line and station number (southerly and seaward directions); the order of station occupancy is shown on the station charts (Figures 2-13). Stations are designated by two groups of digits; the first set indicates the line and decimal fraction and the second set indicates the station on the line. Decimal fractions were not used in 1952. Time is listed as Pacific Standard Time at the start of each tow in 24-hour designation. Methods for determining tow depth, volume of water strained, standard haul factor, and percent sorted were described in the methods section. The values for total fish eggs and larvae represent raw counts (unadjusted for percent sorted or standard haul factor). Ship codes are as follows: BD, *Black Douglas*; CR, *Crest*; HO, *Horizon*; PT, *Paolina T*; ES, *E. W. Scripps*; SB, *Spencer F. Baird*; YE, *Yellowfin*.
- Table 2 - This table lists pooled occurrences of all larval fish taxa taken during 1952 in ranked order.
- Table 3 - This table lists pooled counts of all larval fish taxa taken during 1952 in ranked order. Numbers are adjusted for percent sorted and standard haul factors.
- Table 4 - This table gives numbers of fish larvae for each taxon, listed by station and calendar month in which the tow was taken. Counts are adjusted for percent of sample sorted and standard haul factor. Average values are given for stations occupied more than once during a month. See Table 1 for station and tow data and Table 6 for listing of stations with multiple occupancies during a month. Multiple occupancies occurred when a station was occupied more than once in the same calendar month; in some cases, multiple occupancies resulted from separate cruises. The orders are listed in "phylogenetic" sequence modified from Nelson (1984). Subtaxa within each order are listed alphabetically. Page numbers for each taxon are given in the index at the end of the report.
- Table 5 - This table is a summary of pooled occurrences of all larval fish taxa taken on CalCOFI surveys from 1951 to 1960. Taxa are listed in the same order as in Table 4.

Table 6 - List of stations with multiple occupancies in one month during 1952.

ACKNOWLEDGMENTS

Elbert Ahlstrom, David Kramer, Robert Counts, and James Thrailkill originally identified larvae from CalCOFI cruises of 1952. Ronald Whyte coded each larval fish taxon or type and Rita Ford entered them into the computer. Debby Snow efficiently assisted in all aspects of data editing and retrieval. Cindy Meyer and Larry Zins provided programming assistance. Dorothy Roll designed the CalCOFI data acquisition system and provided data processing support. Ken Raymond, Roy Allen, and Henry Orr helped with graphics and production of the report. Lorraine Prescott and Diane Forsythe prepared the manuscript for printing. Paul Smith determined statistical outliers, provided assistance during geographical outlier checks and offered helpful suggestions throughout the project. Izadore Barrett, Director of the Southwest Fisheries Center and Reuben Lasker, Chief, Coastal Fisheries Resources Division, SWFC, provided the support critical to the completion of the project. James Thrailkill planned CalCOFI surveys and supervised cruises, data handling, and plankton sorting from 1949 to 1986 and is largely responsible for the high quality of these operations. Without the vision and direction of Elbert Ahlstrom and Elton Sette and the dedicated efforts of the many people who collected, processed, and analyzed the samples, this data base would not exist.

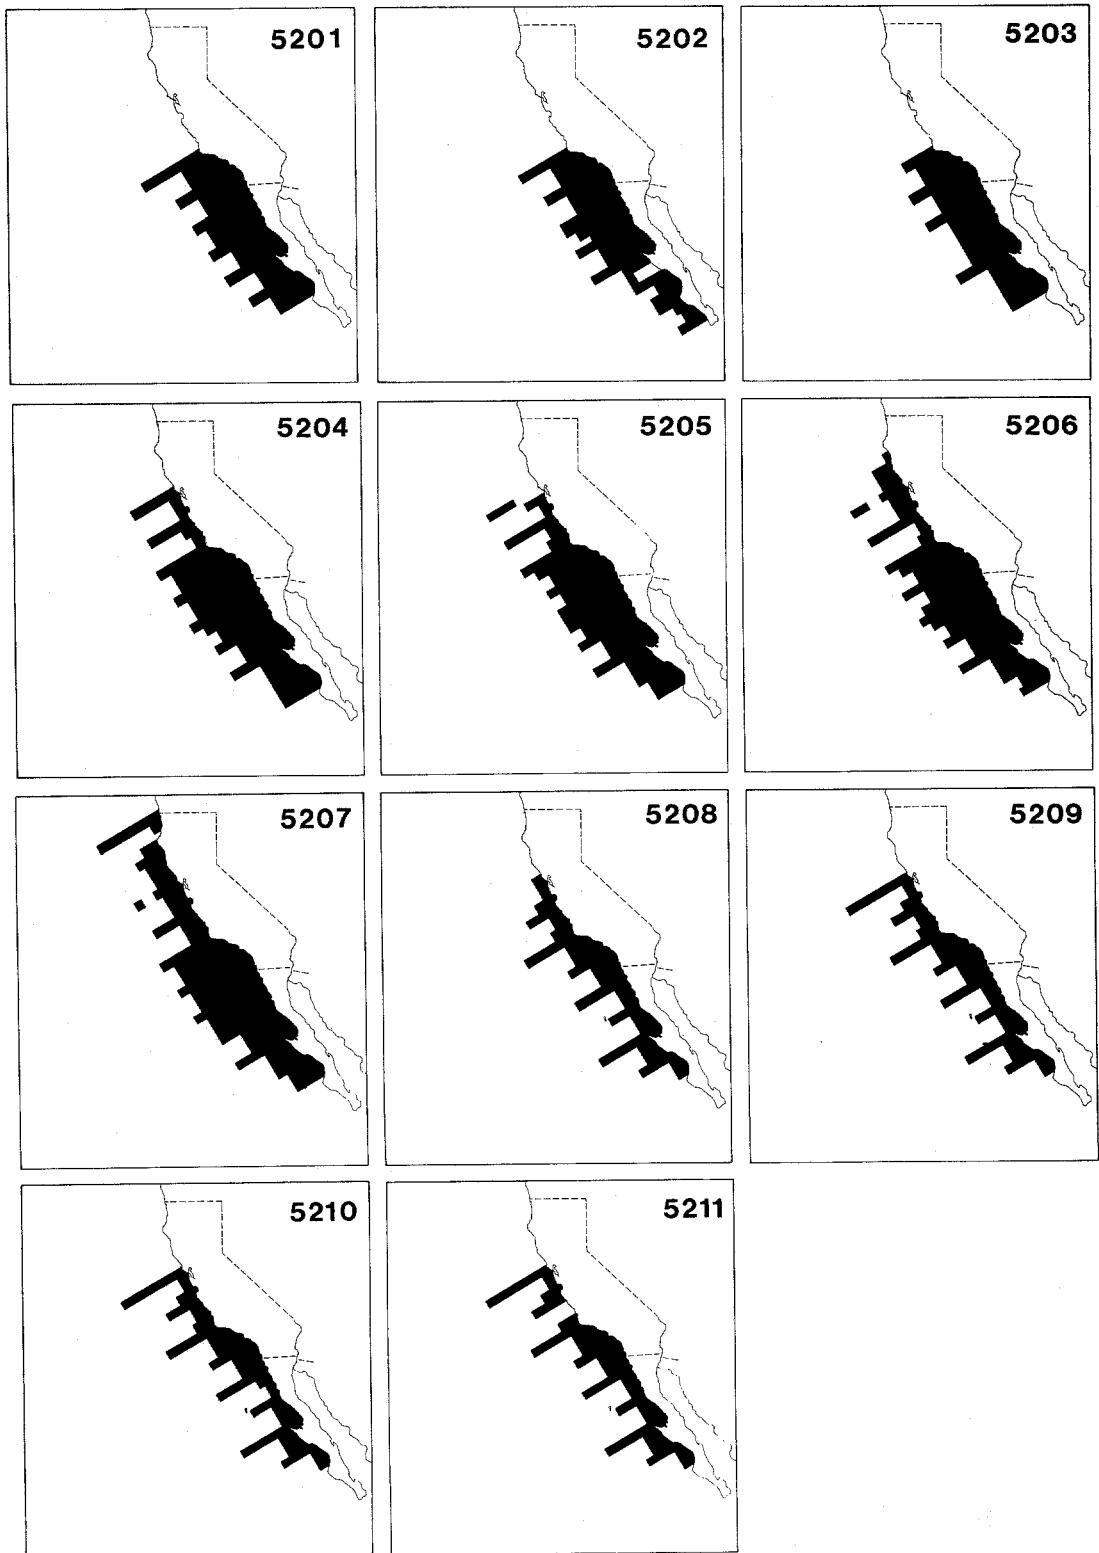

Figure 1. Composite arrangement of diagrammatic charts showing areas sampled on each CalCOFI cruise during 1952.

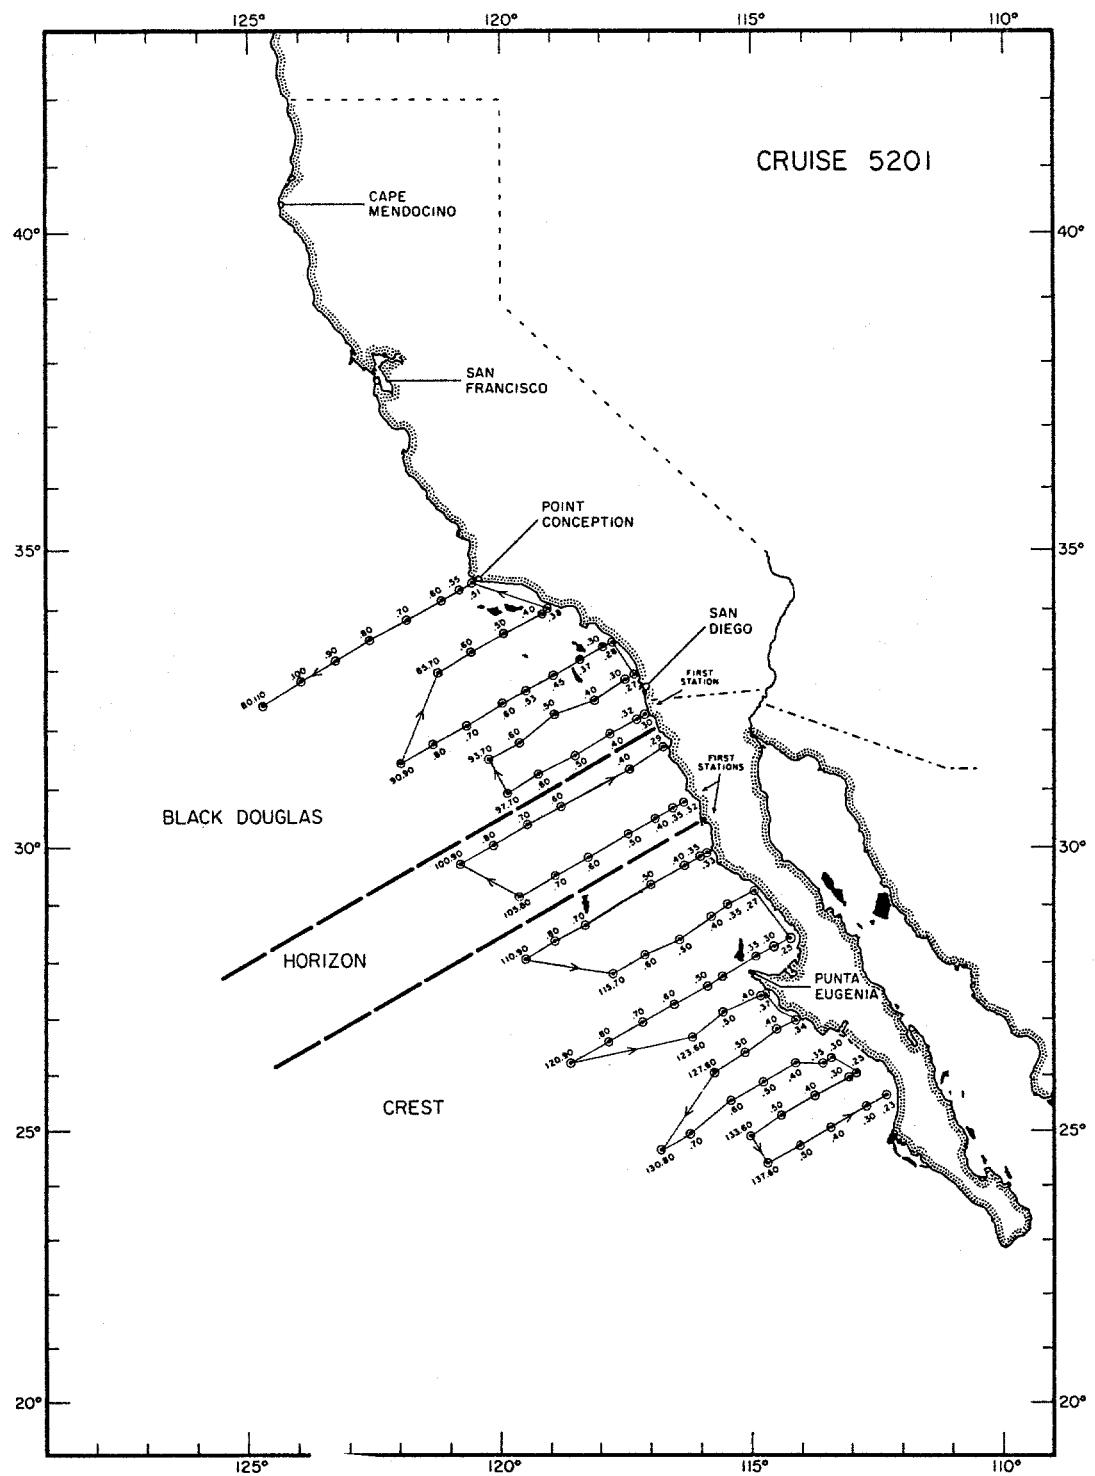

Figure 2. Station pattern for CalCOFI Cruise 5201 showing tracks for each vessel. Stations with plankton tows only are indicated by a dot; those with plankton tows and hydrographic measurements are shown by a dot and circle. Modified from charts in Reid, et al. (1965) to include only those stations listed in Table 1 of this report.

INDEX

This index lists taxa included in Table 4 with their page numbers.

	Page
Anguilliformes	73
Clupeiformes	
Clupeidae	
<i>Etrumeus acuminatus</i>	73
<i>Opisthonema</i> spp	74
<i>Sardinops sagax</i>	74
Engraulidae	
<i>Engraulis mordax</i>	76
Salmoniformes	
Argentinidae	
<i>Argentina sialis</i>	79
<i>Microstoma microstoma</i>	81
<i>Nansenia candida</i>	81
<i>Nansenia crassa</i>	82
Bathylagidae	
<i>Bathylagus ochotensis</i>	83
<i>Bathylagus pacificus</i>	85
<i>Bathylagus wesethi</i>	86
<i>Leuroglossus stilbius</i>	89
Stomiiformes	93
Gonostomatidae	
<i>Cyclothonone</i> spp.	93
<i>Diplophos taenia</i>	96
<i>Ichthyococcus</i> spp.	96
<i>Vinciguerria lucetia</i>	96
Sternopychidae	99
Stomiatoidea	
Chauliodontidae	
<i>Chauliodus macouni</i>	101
Idiacanthidae	
<i>Idiacanthus antrostomus</i>	102
Malacosteidae	
<i>Aristostomias scintillans</i>	103
Melanostomiidae	
<i>Tactostoma macropus</i>	103
Stomiidae	
<i>Stomias atriventer</i>	103
Myctophiformes	
Alepisauroidei	
Paralepididae	105
Chloropthalmoidei	
Scopelarchidae	107
Myctophoidei	
Myctophidae	108
Lampanyctinae	
<i>Ceratoscopelus townsendi</i>	111

	Page
<i>Diaphus</i> spp.	112
<i>Lampadena urophaos</i>	114
<i>Lampanyctus</i> spp.	115
<i>Notolychnus valdiviae</i>	119
<i>Notoscopelus resplendens</i>	120
<i>Stenobrachius leucopsarus</i>	120
<i>Triphoturus mexicanus</i>	123
Myctophinae	
<i>Diogenichthys</i> spp.	127
<i>Diogenichthys atlanticus</i>	128
<i>Diogenichthys laternatus</i>	129
<i>Electrona rissoii</i>	131
<i>Gonichthys tenuiculus</i>	131
<i>Hygophum</i> spp.	132
<i>Hygophum atratum</i>	132
<i>Hygophum reinhardtii</i>	133
<i>Loweina rara</i>	133
<i>Myctophum nitidulum</i>	134
<i>Protomyctophum crockeri</i>	134
<i>Symbolophorus californiensis</i>	138
<i>Tarletonbeania crenularis</i>	140
Synodontoidei	
Synodontidae	
<i>Synodus</i> spp.	144
Gadiformes	
Merlucciidae	
<i>Merluccius productus</i>	144
Macrouridae	
Ophidiiformes	
Bythitidae	
<i>Brosmophysis marginata</i>	149
<i>Carapidae</i>	149
Ophidiidae	
<i>Chilara taylori</i>	150
<i>Ophidion scrippsae</i>	150
Lophiiformes	
Ceratioidei	
Gobiesociformes	
Gobiesocidae	
Beloniformes	
Exocoetidae	
Scomberesocidae	
<i>Cololabis saira</i>	151
Atheriniformes	
Atherinidae	
Lampriformes	
Trachipteridae	
Beryciformes	
Melamphaidae	
<i>Melamphaes</i> spp.	153
<i>Poromitra</i> spp.	156
<i>Scopelogadus bispinosus</i>	156

	Page
Syngnathiformes	
Syngnathidae	
<i>Syngnathus</i> spp.	156
Scorpaeniformes	
Cottoidei	
Agonidae	156
Anoplopomatidae	
<i>Anoplopoma fimbria</i>	156
Cottidae	156
<i>Scorpaenichthys marmoratus</i>	157
Cyclopteridae	157
Hexagrammidae	
<i>Ophiodon elongatus</i>	158
<i>Zaniolepis</i> spp.	158
Scorpaenoidei	
Scorpaenidae	158
<i>Sebastes</i> spp.	158
<i>Sebastolobus</i> spp.	163
Triglidae	
<i>Prionotus</i> spp.	163
Perciformes	
Blennioidei	
Blenniidae	
<i>Hypsoblennius</i> spp.	164
Clinidae	164
Gobioidei	
Gobiidae	165
Icosteoidei	
Icosteidae	
<i>Icosteus aenigmaticus</i>	166
Labroidei	
Labridae	166
Pomacentridae	
<i>Chromis punctipinnis</i>	168
Percoidei	
Bramidae	
<i>Brama</i> spp.	169
Carangidae	
<i>Trachurus symmetricus</i>	169
Kyphosidae	
<i>Girella nigricans</i>	173
<i>Medialuna californiensis</i>	173
Sciaenidae	173
Serranidae	174
Scombroidei	
Gempylidae	175
Scombridae	
<i>Auxis</i> spp.	175
<i>Scomber japonicus</i>	175
Trichiuridae	176
Sphyraenoidei	
Sphyraenidae	

<i>Sphyraena argentea</i>	177
Stromateoidei	
Centrolophidae	
<i>Icichthys lockingtoni</i>	177
Stromateidae	
<i>Peprilus simillimus</i>	179
Tetragonuridae	
<i>Tetragonurus cuvieri</i>	180
Trachinoidei	
Chiasmodontidae	180
Pleuronectiformes	181
Pleuronectoidei	
Bothidae	181
Paralichthyidae	
<i>Citharichthys</i> spp.	182
<i>Hippoglossina stomata</i>	185
<i>Paralichthys californicus</i>	186
<i>Syacium ovale</i>	186
<i>Xystreurus liolepis</i>	186
Pleuronectidae	
<i>Eopsetta jordani</i>	187
<i>Glyptocephalus zachirus</i>	187
<i>Lyopsetta exilis</i>	187
<i>Microstomus pacificus</i>	189
<i>Parophrys vetulus</i>	190
<i>Pleuronichthys</i> spp.	190
<i>Pleuronichthys coenosus</i>	190
<i>Pleuronichthys decurrens</i>	191
<i>Pleuronichthys ritteri</i>	191
<i>Pleuronichthys verticalis</i>	191
Soleoidei	
Cynoglossidae	
<i>Sympfurus</i> spp.	192
Disintegrated fish larva	193
Unidentified fish larva	196

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$4.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Center are listed below:

- NOAA-TM-NMFS-SWFC- 70 The Hawaiian monk seal on Laysan Island: 1984.
T.C. JOHANOS, A.K.H. KAM, and R.G. FORSYTH
(March 1987)
- 71 Preliminary assessment of habitat utilization by Hawaiian green turtles in their resident foraging pastures.
G.H. BALAZS, R.G. FORSYTH, and A.K.H. KAM
(March 1987)
- 72 Forces of change in Hawaii's aku (skipjack tuna) industry, 1986-workshop summary.
C.H. BOGGS and S.G. POOLEY
(April 1987)
- 73 United States North Pacific Albacore Fishery 1961-1980.
A.P. MAJORS
(April 1987)
- 74 Abundance of zooplankton species in California coastal waters during April 1981, February 1982 and March 1985.
A. ALVARIÑO and C.A. KIMBRELL
(June 1987)
- 75 Data report on the vertical distribution of the eggs and larvae of northern anchovy, *Engraulis mordax*, at two stations in the Southern California Bight, March-April 1980.
T. POMMERANZ and H.G. MOSER
(July 1987)
- 76 Report of a marine mammal survey of the Eastern Tropical Pacific aboard the research vessel *David Starr Jordan*, July 29-December 5, 1986.
R.S. HOLT and S.N. SEXTON
(August 1987)
- 77 Report of a marine mammal survey of the Eastern Tropical Pacific aboard the research vessel *McArthur*, July 29-December 6, 1986.
R.S. HOLT and A. JACKSON
(August 1987)
- 78 Results of the Bay Area Sportfish Economic Study (BASES)
C.J. THOMSON and D.D. HUPPERT
(August 1987)
- 79 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1951.
D.A. AMBROSE, R.L. CHARTER, H.G. MOSER and C.R. SANTOS METHOT
(September 1987)
